

The Advanced Persistent Threat

A Cyber Security Challenge

Objectives

- What is Advanced Persistent Threat (APT)
- APT characteristics
- APT challenges
- APT examples
- Symptoms of an organisation being targeted by an APT
- Intrusion detection techniques
- A correlation-based system for real-time APT detection and prediction

What Is Advanced Persistent Threat (APT)

- Well-funded, organised attack groups that have interest in data theft
- A cybercrime category directed at business and political targets
 - Advanced
 - Persistent
 - Threat

APT Life Cycle

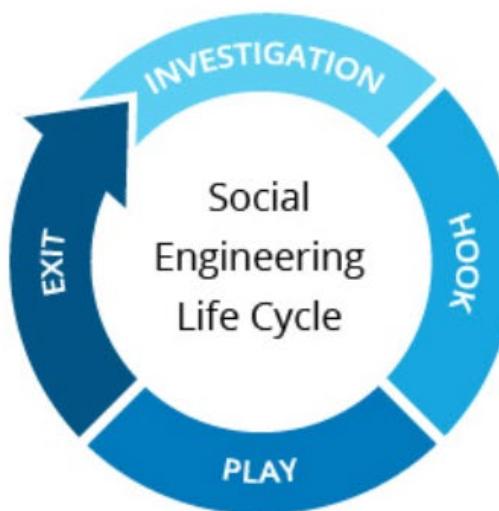

Social Engineering Attack

Preparing the ground for the attack:

- Identifying the victim(s).
- Gathering background information.
- Selecting attack method(s).

**Closing the interaction,
ideally without arousing suspicion:**

- Removing all traces of malware.
- Covering tracks.
- Bringing the charade to a natural end.

Deceiving the victim(s) to gain a foothold:

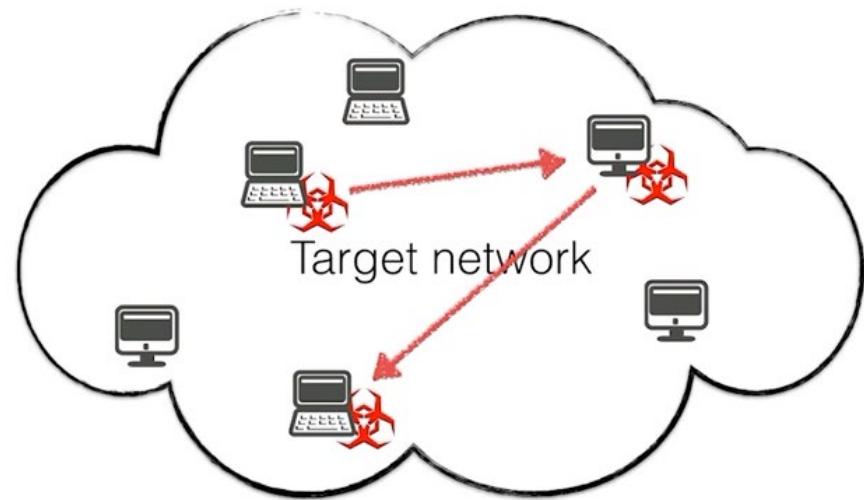

- Engaging the target.
- Spinning a story.
- Taking control of the interaction.

Obtaining the information over a period of time:

- Expanding foothold.
- Executing the attack.
- Disrupting business or/and siphoning data.

APT Characteristics

- APTs are motivated by long-term goals aiming at espionage and political manoeuvring
- Make use of multiple attack vectors and tools
- High degree of stealthiness
- Data exfiltration

APT Challenges

- APTs are targeting selected organizations
- The economic damage resulting of a successful APT can be very expensive
- APTs form a problem for the current detection methods

APT Examples

- The GhostNet cyberespionage operation
 - Was discovered in 2009, executed from China
 - The attackers focused on gaining access to the network devices of government ministries and embassies
- The Stuxnet worm
 - Used to attack Iran's nuclear program, detected in 2010
 - The malware targeted SCADA (Supervisory Control and Data Acquisition) systems

APT Examples

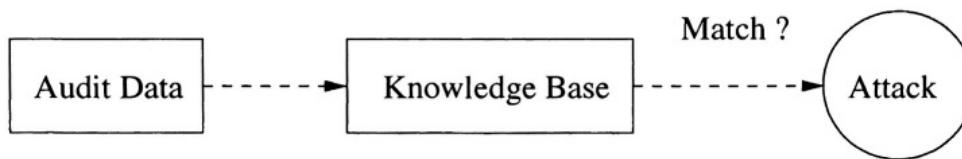

- APT28, the Russian advanced persistent threat group also known as Cozy Bear
 - Has been linked to a number of attacks, including a 2015 spear phishing attack on the Pentagon, as well as the 2016 attacks on the Democratic National Committee
- APT34, an advanced persistent threat group linked to Iran
 - Was identified in 2017 by researchers at FireEye, but has been active since at least 2014
 - The threat group has targeted companies in the Middle East with attacks against financial, government, energy, chemical and telecommunications companies
- APT37, also known as Reaper, StarCruft and Group 123
 - An advanced persistent threat linked to North Korea that is believed to have originated around 2012
 - APT37 has been connected to spear phishing attacks exploiting an Adobe Flash zero-day vulnerability

Symptoms of an Organisation Being Targeted by an APT

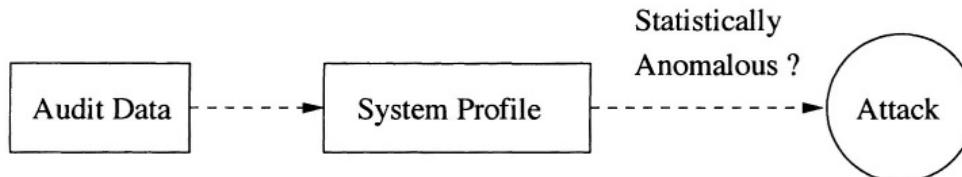

- Unusual activity on user accounts
- Extensive use of backdoor Trojan horse malware
- Odd or uncharacteristic database activity
- Presence of unusual data files

Intrusion Detection Techniques

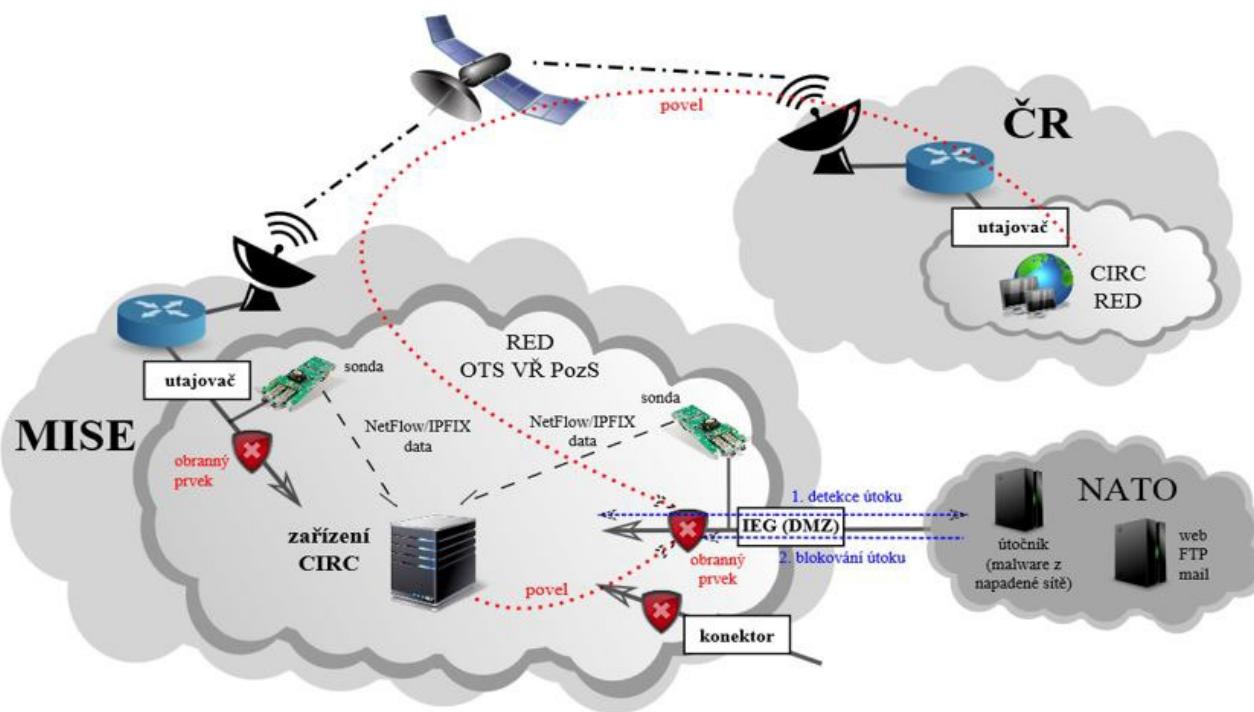

- Static techniques
 - Depend on investigating the hosts' logs after the attack has occurred
- Dynamic techniques
 - Signature-based
 - Anomaly-based

- Anomaly-based

A Correlation-based System for Real-time APT Detection and Prediction

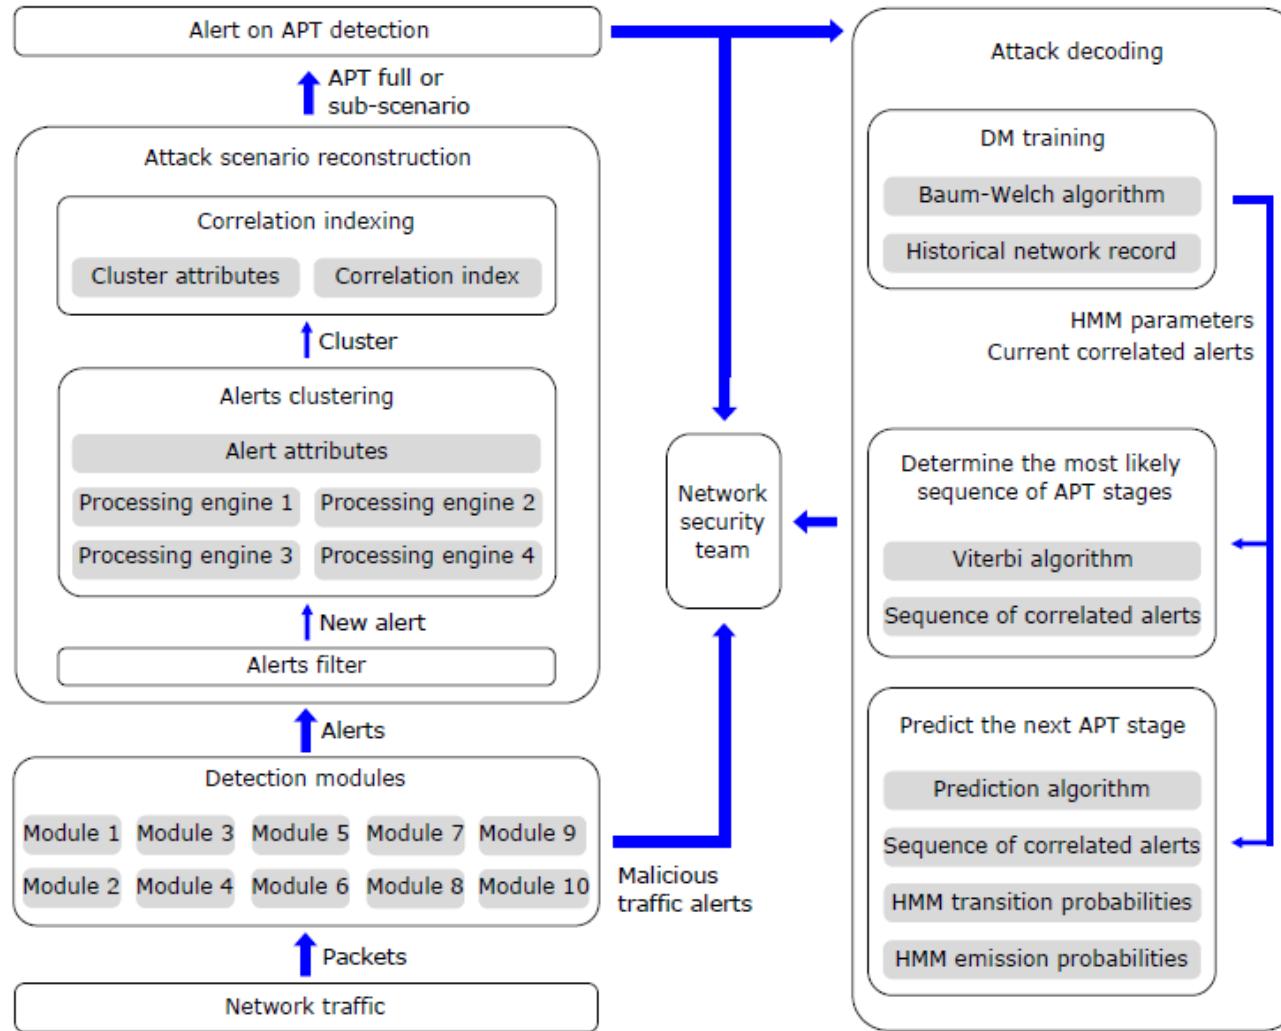

A Correlation-based System for Real-time APT Detection and Prediction

A Correlation-based System for Real-time APT Detection and Prediction

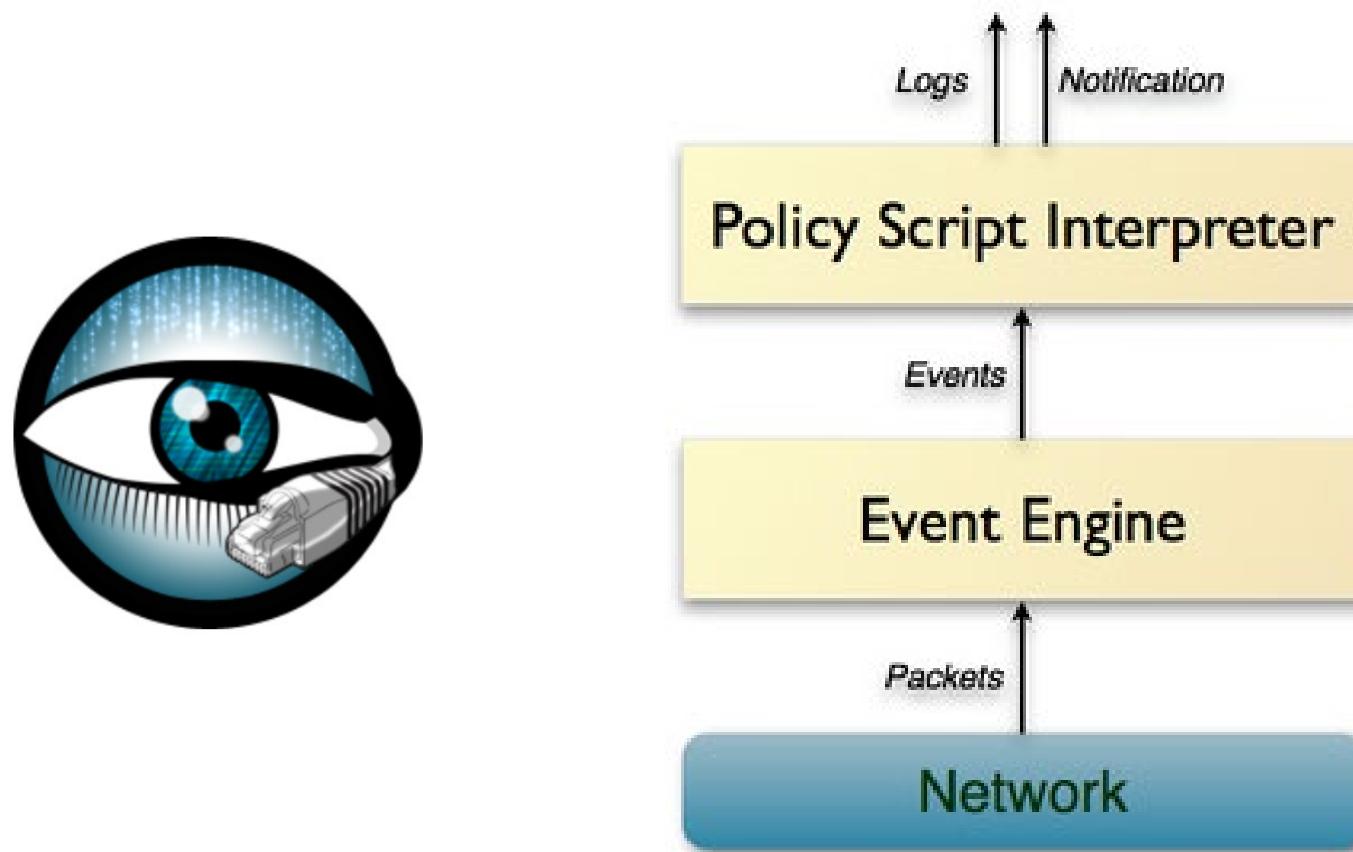

Detection Modules

- Disguised exe file detection
- Malicious file hash detection
- Malicious domain name detection
- C&C communication detection
- Malicious SSL certificate detection
- Domain flux detection
- Scan detection
- TOR connection detection

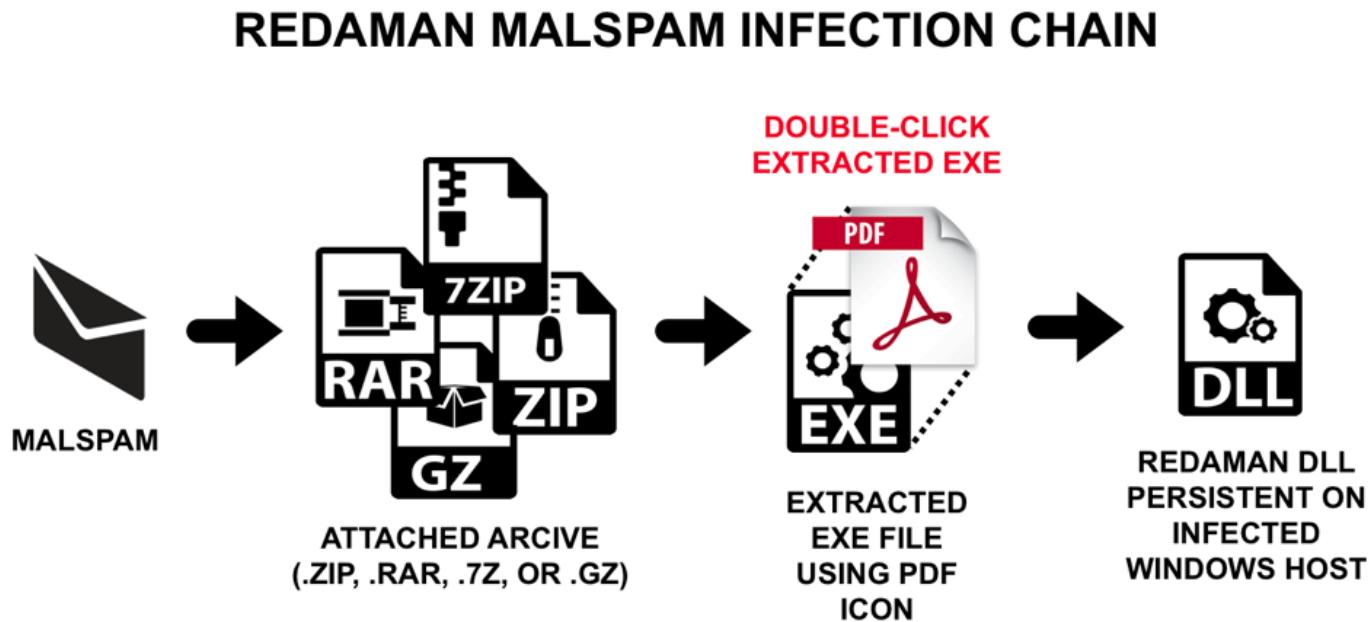

The Zeek Network Security Monitor

Disguised exe File Detection (DeFD)

- The attacker changes the original extension of a piece of malware
- Redaman banking malware

Сверка на оплату.zip 223 KB

Capabilities of Redaman:

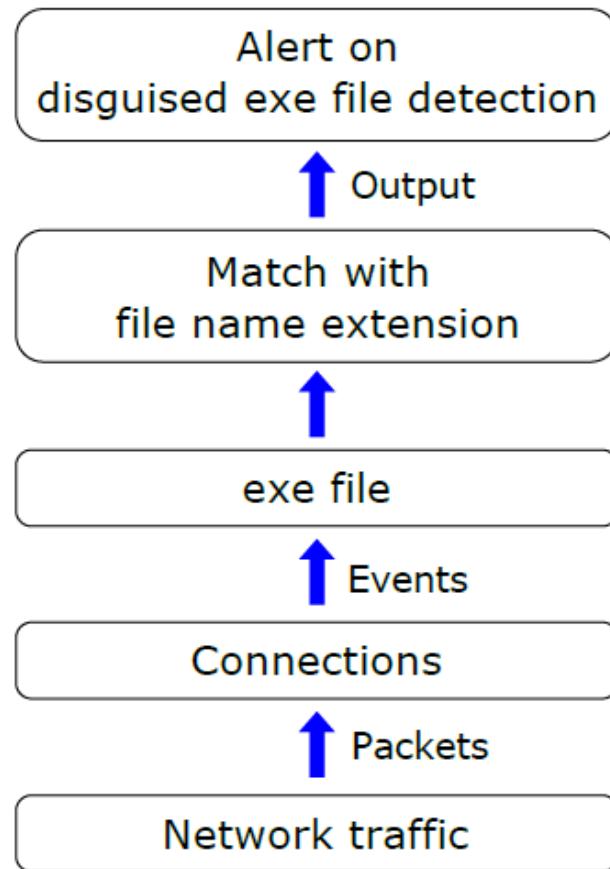

- Monitoring browser activity
- Downloading files to the infected host
- Keylogging activity
- Capture screen shots
- Collecting and exfiltrating financial data
- Shutting down the infected host
- Altering DNS configuration through the Windows host file
- Retrieving clipboard data
- Adding certificates to the Windows store

Disguised exe File Detection (DeFD)

Algorithm 1 Implementation pseudo-code of DeFD

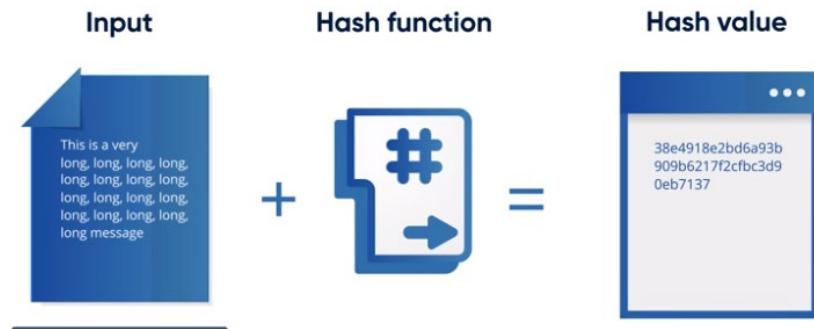

```
1: Get t_exe_file table
2: Get file_over_new_connection event
3: fname  $\leftarrow$  file name
4: if the connection is established by a host from the monitored
   network then
6:   if the file MIME type is in t_exe_file table then
7:     if file MIME type = fname extension then
8:       if the same disguised_exe_alert has been generated over
9:         the last day then
10:          goto End
11:        else
12:          Generate an event (disguised_exe_alert)
13:          Write disguised_exe_alert into disguised_exe_detection.log
14:          Send an alert email to RT
15:          Suppress the same disguised_exe_alert over the next day
16:        end if
17:      else
18:        goto End
19:      end if
20:    else
21:      goto End
22:    end if
23:  else
24:    goto End
25: end if
26: End
```

Disguised exe File Detection (DeFD)

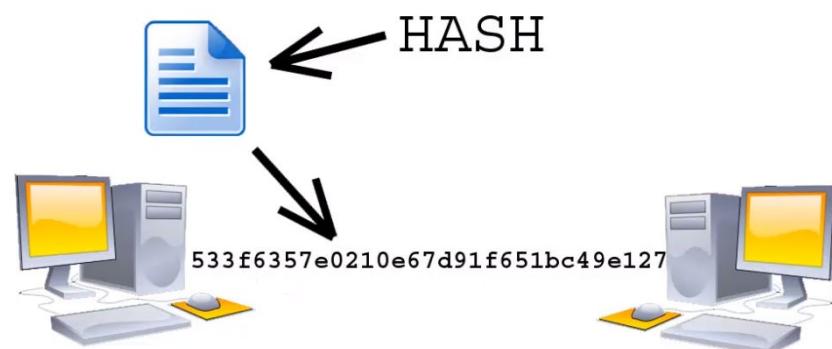

Malicious File Hash Detection (MFHD)

- Hashing is an algorithm that calculates a fixed-size bit string value from a file

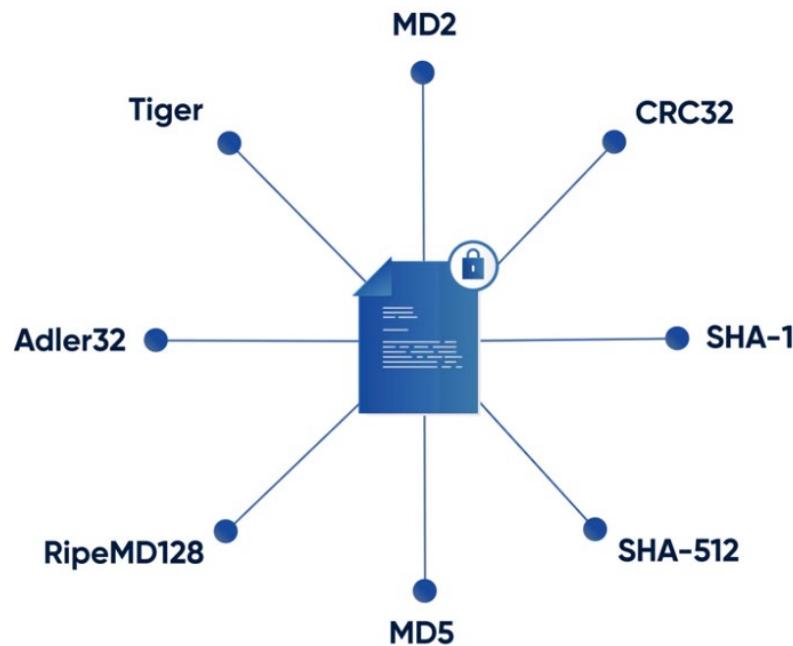

- Avalanche effect
- Unidirectional process
- Should be complex enough

Malicious File Hash Detection (MFHD)

- Used to compare two files for equality
- Used to verify the integrity

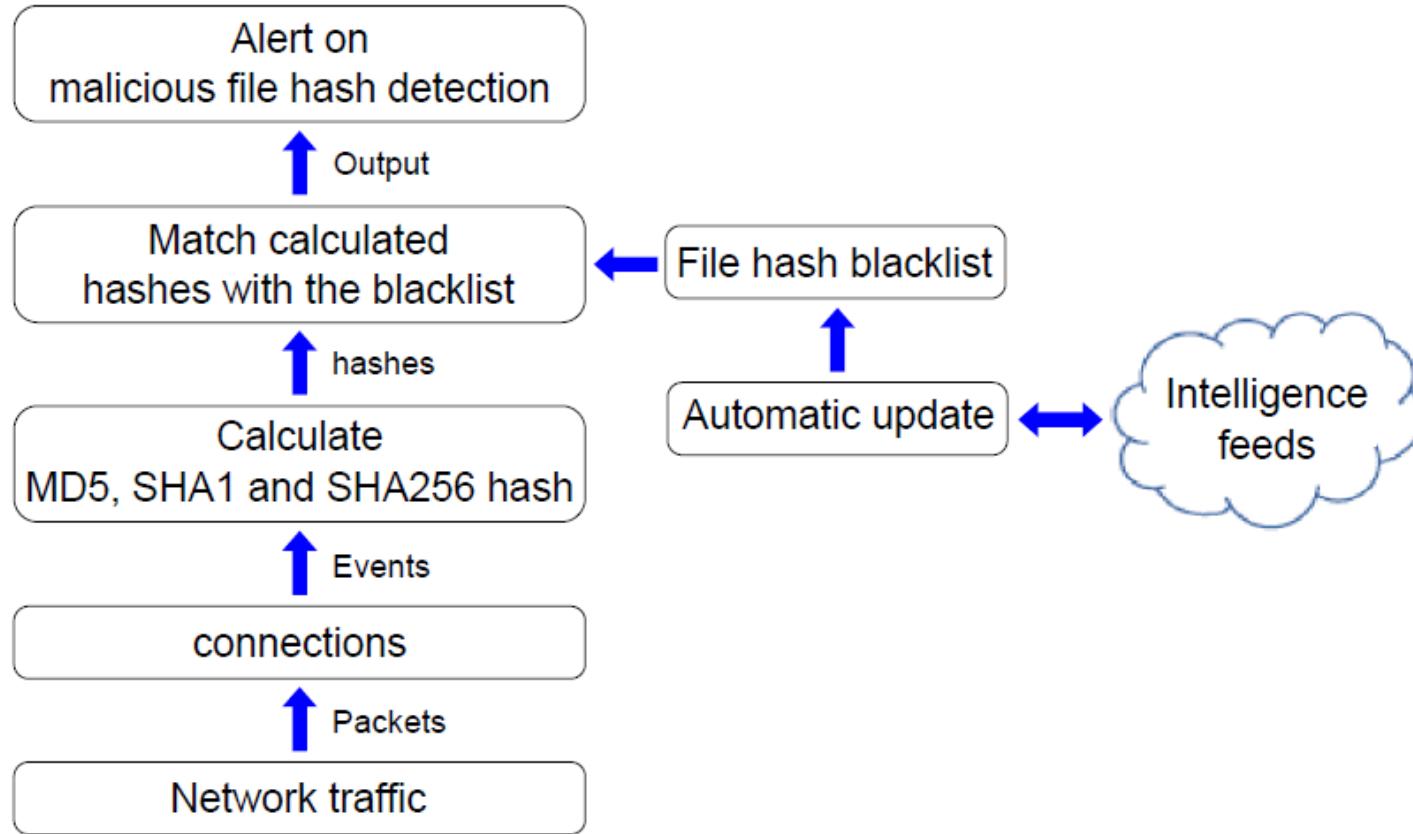

Malicious File Hash Detection (MFHD)

Algorithm 2 Implementation pseudo-code of MFHD

```
1: Get malicious files hashes blacklist (blacklist.intel)
2: Get file_new event
3: Calculate MD5, SHA1 and SHA256 hashes
4: Send MD5, SHA1 and SHA256 hashes to Bro Intelligence Framework
5: if MD5, SHA1 or SHA256 hashes are in blacklist.intel then
6:   | if the connection is oriented to a host from the monitored
7:     network then
8:       | if the same hash_alert has been generated over the last
9:         day then
10:          goto End
11:        | else
12:          Generate an event (hash_alert)
13:          Write hash_alert into blacklist_detection_hash.log
14:          Send an alert email to RT
15:          Suppress the same hash_alert over the next day
16:        | end if
17:      | else
18:        goto End
19:      | end if
20:    else
21:      goto End
22:    end if
23:  End
```
